

Product Requirements Document (PRD)

Detailed product definition, scope, business rules, acceptance criteria and release plan

Product: Closecraft AI Revenue Operating System | Release: MVP / Validation Build | Status: Production engineering baseline | Date: 6 October 2026

Core principle: AI handles speed, repetition and scale. Humans handle judgement, negotiation and high-value sales decisions.

1. Executive Summary

Closecraft is an AI-assisted lead-to-revenue operating system designed for businesses that already generate inbound demand but lose revenue through slow response, inconsistent qualification, weak follow-up, fragmented conversations and poor human handoff. The MVP focuses on a WhatsApp-first lead-to-qualified-opportunity loop rather than attempting to replace a full enterprise CRM.

Primary outcome: Turn more of the leads a business already has into qualified sales opportunities and appointments, while preserving human control over high-value or uncertain decisions.

2. Product Strategy

2.1 Positioning

Primary message: Turn More Leads Into Sales.

Supporting message: AI qualifies, follows up and routes opportunities. Your sales team closes.

Category: AI Revenue Operating System / Lead-to-Revenue Operating System.

2.2 Initial ICP

- Businesses with roughly 50 or more inbound leads per month.
- Businesses where a lead has enough economic value to justify active sales follow-up.
- Teams already using WhatsApp for prospect communication.
- Founder-led sales teams, agencies, professional services, education/training, real estate, consultants and B2B services are initial test segments.
- At least one human sales owner must exist for escalation and closing.

2.3 Anti-ICP

- Businesses with negligible lead volume or transaction value.
- Pure self-service ecommerce where human qualification is unnecessary.
- Teams unwilling to connect lead sources or measure outcomes.
- Use cases requiring autonomous regulated advice, unapproved financial commitments or unsupported sensitive decision-making.

3. Problem Statement

The target customer does not necessarily have a lead-generation problem. It has a lead-conversion operations problem. Leads arrive across channels, response quality varies by staff member, follow-up is forgotten, qualification is subjective, managers lack visibility and high-intent prospects can disappear before a salesperson acts.

4. Goals and Non-Goals

Goals	Non-Goals
-------	-----------

Reduce response time; improve qualification completion; create more qualified opportunities; increase appointments; make human intervention explicit; prove customer ROI.	Replace Salesforce/HubSpot; build a closer marketplace; ship voice AI; support every channel; build enterprise forecasting; autonomously negotiate discounts without authority.
---	---

5. Personas and Jobs-to-be-Done

Persona	Jobs-to-be-Done	Success Signal
Owner/Admin	Configure the revenue engine, integrations, qualification and governance; see whether Closecraft pays for itself.	Clear ROI, low operational risk, renews subscription.
Sales Manager	Know which leads matter, who owns them and where AI needs review.	Fewer missed leads, faster team action, visible accountability.
Closer/Sales Rep	Understand a lead quickly and take the next best action.	Less admin, more qualified conversations and appointments.
Setter/SDR	Qualify, follow up and schedule efficiently.	Higher qualification and booking throughput.
Lead/Prospect	Get fast, relevant responses without repetitive or misleading automation.	Useful conversation, easy opt-out and simple booking.

6. Scope and Priorities

Capability	Priority	MVP Definition
Multi-tenancy & RBAC	P0	Isolated workspaces, users, memberships and roles.
Lead capture	P0	WhatsApp, API/webhook, manual create/import, source attribution and deduplication.
Lead workspace	P0	Profile, timeline, conversation, qualification, owner, next action and outcome.
AI qualification	P0	Workspace-specific questions, factors, score, confidence, evidence and recommendation.
Human review	P0	Approve, edit, reject, assign or handle manually based on policy.
Follow-up	P0	Configurable sequence, quiet hours, retries, stop conditions and opt-out.
Appointments	P0	Calendar availability, booking, confirmation and status.
Dashboard	P0	Attention queue and validation KPIs.
Audit & governance	P0	Material AI, human, configuration and security events.

Knowledge base	P1	Approved business facts used to ground AI replies.
Billing/usage	P1	Plan, usage, payment status and pilot limits.
Advanced automation canvas	P2	Post-validation.
Advanced revenue intelligence	P2	Post-validation.

7. Detailed Functional Requirements

7.1 Authentication and Workspace

- Email/password or supported identity provider authentication.
- Create workspace during onboarding.
- Owner can invite users and assign supported roles.
- Server-side tenant isolation is mandatory for every tenant-owned record.

7.2 Dashboard

- Lead with 'Needs Your Attention' rather than vanity charts.
- Show new leads, qualified leads, appointments, overdue follow-ups, review items and outcome value where available.
- Each card must deep-link to the actionable record.
- Filters: date range, owner, source and status where applicable.

7.3 Leads

- Search, filter, sort and saved views.
- Canonical statuses: New, Engaged, Qualifying, Qualified, Appointment, Opportunity, Won, Lost.
- Lead detail combines profile, timeline/conversation and AI intelligence.
- Allow manual owner assignment, stage update, notes and outcome recording.

7.4 AI Qualification

- Admin configures ideal customer criteria, questions, disqualifiers, factor weights and thresholds.
- AI extracts explicit facts and inferred signals separately.
- Unknown information remains unknown.
- Assessment contains score, confidence, factor breakdown, evidence references and recommended next action.
- Low-confidence or restricted actions route to human review.

7.5 Human-in-the-Loop

- Dedicated AI Actions queue with urgency and confidence filters.
- Policy triggers include high deal value, low confidence, pricing/discounts, negotiation, complaints, sensitive topics and custom rules.
- Reviewer can approve, edit, reject, assign or take over.
- Every review decision is logged.

7.6 Follow-up

- Sequences use configurable delays and maximum attempts.
- Before every send, re-check reply state, opt-out, human takeover, appointment, won/lost and quiet hours.
- Replies cancel or recalculate pending steps.
- Do not continue persuasion after explicit opt-out.

7.7 Appointments

- Connect at least one calendar provider.
- Offer only provider-confirmed availability.
- Do not mark booked until provider confirms.
- Support confirmed, rescheduled, cancelled, completed and no-show states.

7.8 Knowledge

- Admins add approved product/service, pricing, FAQ, objection and company information.
- Only active workspace knowledge may ground that workspace AI.
- Changes are versioned or timestamped for traceability.

7.9 Analytics

- North star: qualified opportunities generated.
- Track first-response time, contact rate, qualification completion, appointment rate, human override rate, conversion and revenue per lead when outcome data exists.
- Pilot export must support before/after analysis.

8. Business Rules

ID	Rule
BR-01	AI may only execute actions explicitly permitted by workspace policy.
BR-02	Permissions, consent, billing and tenant isolation are deterministic controls, never AI decisions.
BR-03	Opt-out immediately blocks future automated outbound messages on that channel.
BR-04	Human takeover pauses incompatible automation.
BR-05	A provider failure cannot be presented as a successful message or appointment.
BR-06	Low-confidence qualification cannot be represented as certainty.
BR-07	Cross-tenant data access, retrieval or model context is prohibited.
BR-08	All material AI recommendations and human overrides must be auditable.

9. UX and Design Requirements

- Desktop-first operational shell with responsive mobile workflows for hot leads, review, reply, assignment and appointments.
- Design language: premium, intelligent, commercial and trustworthy. Avoid sci-fi AI aesthetics and decorative complexity.
- Core palette: dark navy #0C1424, surface #111C30, warm off-white #F5F1E8, muted #AEB9CC, electric blue #4F7CFF.
- Use skeletons for loading and meaningful processing states for AI.
- Meet WCAG 2.2 AA for core flows, including keyboard navigation, focus visibility, labels and non-colour status cues.

10. Success Metrics and Validation

Metric	Definition	MVP Target Type
Qualified opportunities	Leads meeting configured threshold and accepted by workflow.	Primary north-star; improve versus baseline.
Median first response	Lead receipt to first valid response.	Material reduction versus baseline.
Qualification completion	Completed qualification / engaged leads.	Increase.
Appointment rate	Booked appointments / eligible leads.	Increase.
Human override rate	Edited/rejected reviewed AI actions / reviewed actions.	Monitor quality, not minimise blindly.
Pilot-to-paid renewal	Paid pilots that continue.	Key willingness-to-pay signal.
Customer ROI	Incremental attributable value / Closecraft cost.	Positive and explainable.

11. Release Acceptance Criteria

- Inbound lead is captured in the correct workspace with source attribution.
- Lead can receive a compliant response, complete qualification and receive a structured assessment.
- High-risk or low-confidence action can be intercepted by human review.
- Human can take over, reply, assign and book/record an appointment.
- Follow-up respects stop conditions and opt-out.
- Material actions are auditable.
- Tenant isolation and RBAC pass security tests.
- Pilot metrics are reportable/exportable end-to-end.

12. Delivery Phases

Phase	Deliverable	Exit Criterion
1	Foundation: auth, workspace, RBAC, DB, audit, CI/CD.	Tenant isolation and deployment verified.

2	Lead core: capture, dedupe, list/detail, timeline.	Inbound lead reliable.
3	Messaging: WhatsApp, conversation UI, delivery states, opt-out.	Two-way messaging verified.
4	AI qualification: profiles, structured outputs, confidence, evaluation.	Representative evaluation baseline passes.
5	Human control: review queue and approvals.	Restricted actions cannot bypass policy.
6	Follow-up scheduler and stop conditions.	No duplicate/unsafe sends in E2E tests.
7	Calendar and appointment state.	Provider-confirmed booking works.
8	Dashboard, outcomes and export.	Pilot metrics measurable.
9	Hardening: security, accessibility, load, recovery and observability.	Production readiness gate passes.

13. Risks and Mitigations

Risk	Mitigation
AI becomes a commodity CRM feature	Compete on measurable lead-to-revenue workflow, WhatsApp-first operations, human control and customer-specific process data.
Hallucinated or unsafe responses	Grounded knowledge, structured outputs, deterministic guardrails, review thresholds and evaluation suite.
Messaging/provider dependency	Adapter layer, health monitoring, retries and graceful manual fallback.
Weak willingness to pay	Paid pilots, ROI baseline, renewal test and narrow ICP before expansion.
Overbuilding	Strict P0/P1/P2 release boundary and validation gate.
Tenant/privacy incident	Server-side isolation, least privilege, encryption, audit and security testing.
